REQUIREMENTS TEAM NUT

1. Reminders - Konstantin Aleksandrov

As a logged in **user** I would like to be able to add and receive remainders that will be displayed as notifications on my desktop.

Problem:

Users sometimes forget to take their meals or drink water which makes it hard to follow their meal plan.

Future:

There will be a Reminders icon button

On click the user will be taken to the Reminders tab.

There the user should be able to add reminders

To add a reminder the user should click on the "Add Reminder" button.

Upon clicking the Add Reminder button a form will appear with three fields and a submit button.

The fields are:

Title – an input field that accepts a string of alpha-numeric characters and special characters with a maximum length of 30 characters

Date/Time - a datetime picker which accepts a valid date and time

Recurrence - a dropdown that lets you pick between "daily" or "weekly"

The submit button is disabled until all the fields above are completed with valid data.

Upon clicking the submit button the data will be saved and reminders will be sent based on the inputted data.

2. Logging and daily/weekly reports - Claudiu Grigore (Cross-team VibeCoders)

As a logged in **user** I want to be able to log my meals and get daily and weekly reports based on my meals.

Problem: Right now an user isn't able to log their meals and keep track of their daily and weekly consumption.

Future:

There will be an Logging button.

On click the user will be taken to the logging tab.

There the user should be able to add a meal my selecting a meal from the database or by specifying each ingredients.
Two buttons will be present, one titled "Select meal" and the other "Build meal"

On clicking the "Build meal" button the user will be prompted with a window where they will be able to select from a list of ingredients and a field that accepts valid positive integers where they will able to specify the quantity of the ingredient in grams.

On clicking the "Select meal" button the user will be prompted with a window where they will be able to select from a list of meals from the database.
Also in both of these windows there will be a button titled "Confirm meal".

Upon clicking the button the calories and macros for the meal will be calculated using data from the database and the meal will be saved.

At the end of a day the user will be shown a window.

At the top of the window there will be a text displayed reading "Daily Report".

In the window calories and macros for the day will be displayed.

At the bottom of the window there will be a button titled "OK"

Upon clicking the button the window will be closed.

At the end of a week the user will be shown a window.

At the top of the window there will be a text displayed reading "Weekly report".

In the window average daily calories and macros for the week will be displayed.

At the bottom of the window there will be a button titled "OK"

Upon clicking the button the window will be closed.

3. Generate shopping lists based on your current meal plan - Guilherme Chagas

As a logged in **user** I would like for the app to provide a shopping list for me based on my meal plan

Problem:

Right now the user is not provided with shopping lists specifying the ingredients needed for his meal plan so the user might not be able to make certain meals because of lack of ingredients.

Future:

In the future there will be an Icon button with a shopping cart.

Upon clicking the button the user will be redirected to a shopping list tab.

In the tab there will be a list of products which will be used for future meals in their meal plan.

On the right side of each item In the list there will be two buttons:

The first one will display a tick mark and upon pressing it the item will be removed from the list and added to the users inventory.
The second one will display an "X" and upon pressing it the item will be removed from the list but NOT added to the users inventory.
An icon button with a plus symbol will be present at the bottom right of the tab.

On clicking it the user will be prompted with a field and a button.

The field accepts at most 50 characters in which the user can input any additional products they want to add to the shopping list.
The button will read "Add to list" and upon the user pressing it if the field above is not empty and the input is valid, it will be added to the shopping list.

4. Generate meals based on your pantry's inventory - Ioan Burz

As a **user** I want to easily be able to cook meals based on what I already have in my fridge and pantry.

Problems:

Right now our meal plans can't provide meals that the user can easily cook with what they already have in their fridge and pantry.

Future:

- The application should keep inventory of what ingredients the user has in a database.
- Whenever an user logs a meal the ingredients for it will be removed from the database.
- Whenever an user marks off items from their shopping list they will be added to the database.

The application will generate meals that use only ingredients that the user has, these will be provided by the database.
There will also be a button labeled "Inventory".

Upon pressing it the users will be redirected to a tab titled Inventory.

In the tab there will be a list of all items provided from the database.

On the right side of each item In the list there will be a button display an "X" and upon pressing it the item will be removed from the list and database.
On the bottom right of a tab there will be a button displaying a cross.

Upon clicking this button the user will be prompted with a window In which the user will be able to choose from a list of ingredients.

In the window there will also be a field that accepts valid positive integers where they will able to specify the quantity of the ingredient in grams.
And also a button which is labeled with "add".

Upon clicking the button if all the fields above are complete and valid the item will be added to the list and database and the window will close.

5. Favorite meals - Razvan Bichiu

As a **NUT application user** I want to be able to favorite meals

So that the application generates daily meal plans more suited to my tastes

Problem:

Right now the app generates a daily meal plan just based on

user data such as allergies, goals, etc.

There is no way for a user to choose what meals he would prefer more in his daily meal plan

Future:

In the future, inside the meal search view, each meal should have a small grey star to the right.

When an user clicks the star, it is saved to the database and appears as a yellow star

If an user has favorited meals,
it will be appear in their next meal generation if it has not been in one in the last 3 days.

6. Automatically generate meal plans based on user given data - Mirko Ruiz

As a user I want to be given a meal plan that incorporates my needs and goals.

Problem:

Currently an user is not provided with meal plans that suit their personal needs and goals.

Future:

In the future the first time a user logs in they will be prompted with a window.

In the window there will be five fields labeled:

Weight(kg) – an input field that accepts a valid positive integer which represents the users weight in kilograms

Height(cm) – an input field that accepts a valid positive integer which represents the users height in centimeters

Age – an input field that accepts a valid positive integer which represents the users age in years

Gender – a dropdown field that lets the user choose between "male" or "female"

Goal – a dropdown field which lets the user choose between "bulk", "cut", "maintenance" or "well-being".

Before clicking done, a text will pop up, that based on this data (BMI) will recommend what a better suited goal would be

If all the fields are completed correctly the user will be able to press a button at the bottom at the window displaying "Done".

Upon pressing the button their calorie and macronutrient needs will be estimated using a formula and the window will be closed.

After this is calculated and all of the data is taken into consideration a meal plan will be created suiting the user's needs and goals.

This data can be edited later by a logged in user by going into the setting window and inputting new values for these.

7. Nutritionist chats - Anisia Bantu

As a logged in user I want to be able to have the ability to chat with a professional nutritionist to better plan my meals.

Permissions:

Nut app User can read/write messages in their own chat

NUT Nutritionists can read/write messages in any user chat

Problem:

Right now an user doesn't have the ability to get professional advice based on their specific needs and plans.

Future:

User View

In the future there will be an icon button with a chat.

Upon clicking the button the user will be a chat window with a nutritionist messages appearing on the left and the users messages appearing on the right.

An add message field will be visible at the bottom of the page with a submit button to the right of it.

The user will be able to add a comment which is made of a string of at most 300 characters.

On submit the message will be saved and displayed int the comment window.

Both the nutritionist and the user should be able to do this.

A logged in **Nutritionist** will be able to see a list of all open comments

He can click a list item and be redirected to the chat with the respective user

8. Meal Search with Filtering - Stefan Baldean

As a logged in **user** I want to be able to filter meals by certain criteria like allergies or specific diets.

Problem:

Right now an user cannot easily find meals that meet their personal allergies or diet.

Future:

In the future, on the meals page, there will be a button labeled "Filter"

Upon clicking the button a form will appear with a dropdown.

The dropdown will allow the user to pick between certain allergies or diets like: keto, vegan, gluten-free, no peanuts, lactose-free etc.
